# FACTS \& FIGURES OF THE CHEMICALINDUSTRY 

A leaner chemical industry made the most of a SHALLOW RECOVERY

THE GLOBAL CHEMICAL industry had a very good year in 2010. The tables in the following pages of this issue are chock-full of large, positive numbers. For executives, the phrase "global economic recovery" replaced the much more frightening words "inventory destocking" that were common in 2008 and 2009.

Those leaders began 2010 knowing that the recession was truly over, but that fact brought them little comfort. They had no way to predict the shape of the recovery, or what would happen to underlying demand for chemicals. Late 2009 saw customers finally starting to put in orders again-mainly because their shelves were empty-but that trend did not offer useful evidence.

So rather than compare their company performance with that of 2009, most firms were tracking sales on a quarter-to-quarter basis during 2010. Selling more electronic and performance materials was a positive sign, but it took the full year before demand picked up for other chemical products.

While they watched the quarterly re-
ports, chemical executives continued to control costs; however, most of the large cost-cutting programs wound down in early 2010. In conference calls with analysts, chief executive officers said that productivity improvements would allow them to increase output without hiring workers or building new plants. Indeed, capital spending and hiring were stagnant at most firms. Many firms did renew funding for research and development, however.

By the end of 2010, chemical production had increased at rates ranging from $3.5 \%$ for the U.S. to $11.1 \%$ for Taiwan. Still, it was not enough to make up for the significant drop in manufacturing that occurred in 2008-09. For the U.S., Canada, Western Europe, and Japan, meeting or surpassing the boom levels of 2007 will take many years. Meanwhile, chemical firms in South Korea and Taiwan are increasing production-and exports-at comparatively faster rates.

But global trade offered hope for companies in mature economies. The U.S., Europe, and Japan significantly increased chemical exports to developing nations such as China and Brazil in 2010. If U.S. chemical makers had to rely on domestic demand they would have been in a difficult spot. China's gross domestic product increased by more than $10 \%$ in 2010; in contrast, GDP growth in the U.S. was an anemic 2.9\%.

C\&EN staff members who collected industry data from the major chemical-producing countries and regions are Assistant Managing Editor Michael McCoy, Senior Correspondent Marc S. Reisch, Senior Editor Alexander H. Tullo (all three in C\&EN's Northeast News Bureau), and Senior Correspondent Jean-François Tremblay (Hong Kong). Senior Editor Melody M. Bomgardner (C\&EN's Northeast News Bureau) collected data and coordinated the work.

Record year for overall chemical production in U.S. and Japan:

In South
Korea and Taiwan:

Average U.S. commodity price increase from 2009: 6.8\%

Industrial chemicals: 15.0\% Pharmaceuticals: 5.2\%
U.S. chemical shipments jumped 7.7\%, and Canada's surged 6.8\% ...

... U.S. and Canadian prices increased $7.5 \%$ and $3.8 \%$, respectively

SOURCES: U.S. Departments of Labor and of Commerce, Statistics Canada

Average change in U.S. chemical firms' earnings per share from 2009:
27.0\%

Average change in U.S. pharma and biotech firms'
earnings per share from 2009:
-9.8\%

# A LONG YEAR OF DEMAND RECOVERY 

## Cost cutting boosted FINANCES, but it took four quarters for sales volumes to return

THE CHEMICAL INDUSTRY saw its fortunes turn on a dime in early 2010. Demand from customers facing depleted inventories fueled a brisk rebound from the recession of 2007-09. As the year progressed, stronger sales spread to almost all sectors of the chemical economy.

For U.S. chemical makers, the recession hit its lowest point in the first quarter of 2009. One year later, earnings were up by a striking $167 \%$. Electronics and performance materials were the first to bounce back, as a result of renewed global demand for photovoltaics, semiconductors, autos,
and consumer products. Although sales were strong in some segments, much of the earnings jump was due to severe costcutting programs that continued into 2010.

Dow Chemical was able to take advantage of the improvements in so-called ear-ly-cycle markets thanks to its integration of Rohm and Haas businesses. But it also profited on the commodity side by raising prices for basic plastics. Fast-growing customers in Asia-Pacific and Latin America were willing to absorb the hikes. Meanwhile, DuPont added profits from its agriculture and nutrition division, mostly due
to strong U.S. sales in its seed business.
Still, for Dow, DuPont, and most other U.S. chemical firms, it would take the rest of 2010 to approach prerecession sales volumes for many products. And chemical executives were careful to point out that the global economic recovery was modest. In the meantime, they warned investors that the flip side of recovery would be higher costs for energy and raw materials.

By midyear, demand had returned for intermediate chemicals and specialty chemicals for packaging and coatings, particularly from Asia. But few of those sales went to construction in the developed world, a market that stayed in the dumps throughout the year. And it wasn't until the fourth quarter that chemical firms could say that volumes grew in nonconstruction markets in the U.S. and Western Europe.

CHEMICAL COMPANIES based in Europe had a ride similar to that of their U.S. counterparts in 2010. Firms such as Arkema and DSM that were able to answer rising
demand for performance products were first to heal battered balance sheets. By the end of the year, most sectors had recovered to prerecession volumes. Construction chemicals and pharmaceuticals continued to be a drag on earnings, however.

Only two of the European chemical firms tracked by C\&EN-Solvay and Ke-mira-posted a sales decline in 2010. But both completed major divestitures during the year. And earnings increased for every firm except Bayer and GlaxoSmithKline.

Japanese firms were also reporting strong earnings by the second quarter. The industry was in a good position to export electronics materials to other markets in Asia where demand was vigorous. Meanwhile, Shin-Etsu Chemical was able to do what other companies could not: It found
international buyers for polyvinyl chloride resins.

Still, the increased orders were not enough to entice chemical firms to invest in more plants and equipment. Indeed, manufacturing facilities were not working anywhere near maximum capacity. Capital expenditures were mostly flat in the U.S., Europe, and Japan. But all regions kept up their spending on research and development, because companies recognized that new products were what allowed them to increase earnings as the recession faded away.

RESEARCH SPENDING did not rescue the pharmaceutical industry in 2010. Compared with the chemical industry, drug makers had a lousy year, returning on average worse results for shareholders than in
2009. The reawakening global economy also did little to help firms make money in pharmaceuticals. Instead, companies were beset by expiring patents on blockbuster drugs, stalled pipelines for new compounds, pricing pressures, and even costs related to health care reform.

One example of a pain point was Pfizer's cholesterol drug Lipitor, which will lose patent protection in the U.S. in November of this year. In 2010, sales of the drug were hurt by new generics competition in Spain and Canada.

To help stop the bleeding, pharmaceutical firms have worked to drastically pare their R\&D programs. Large acquisitions in 2009, such as Merck \& Co.'s purchase of Schering-Plough, led to an acceleration of the streamlining process in 2010.

## U.S. SHIPMENTS

## EXPLANATION

## Column Headings In Tables Of Company Results

Year. Data are for the calendar year unless otherwise indicated. Data for earlier years are not restated to reflect subsequent acquisitions or divestitures.

Net sales. Gross sales less discounts, allowances, and returns; generally excludes excise taxes and other operating income or revenue.

Earnings. Net sales and other income less operating costs, nonoperating charges, depreciation, depletion, interest expense, deferred charges, minority interest in income, and taxes. Nonrecurring or extraordinary credits and charges may be included.

Profit margin. Earnings divided by net sales, expressed as a percentage.

Total assets. Sum at year's end of current assets, investments, prepaid expenses, net plant and equipment, and other tangible assets. Excludes insofar as possible intangible assets, including goodwill, value of patents, and the like.

Stockholders' equity. Equity at year's end of preferred and common stockholders, including value of capital stock, capital and earned surplus, and surplus reserves, as well as contingency and miscellaneous reserves for which no definite purpose is stated. Intangible
assets are deducted insofar as possible.

Return on equity. The amount of net income returned as a percentage of shareholders' equity.

Capital spending, \% of sales. The percentage of sales revenues spent on long-term assets such as property, plant, and equipment.

R\&D spending, \% of sales. The percentage of sales revenues spent on research.

Earnings per share. Earnings less preferred dividends, divided by the number of shares of common stock outstanding.

Dividend, \$ per share. Cash dividends paid (or declared) on each share of common stock; excludes the value of stock dividends and adjusted for stock splits.

## Dividend yield, \% of price.

Dividend per share divided by the average of the high and low prices of the common stock during the year.

Stock price range. High and low market prices of common stock during the year, adjusted for stock splits but not stock dividends.

## Price/earnings ratio.

Average of the high and low prices of the common stock during the year divided by earnings per share.

## U.S. COMPANY RESULTS

## Most chemical firms increased earnings in 2010, but lack of new products harmed pharma firms' earnings

(Monetary figures, except per-share amounts, are in millions of dollars)

## U.S. manufacturing employment in 2000:

## In 2010:

## All manufacturing employment: <br> 4 5 million

—Chemical employment:<br>0.78<br>million

## CHEMICALSECTOR'S JOBLESS RECOVERY

A wobbly rebound, high productivity, and pharma mergers prevented EMPLOYMENT growth

ALTHOUGH 2010 marked the return of demand and earnings for the global chemical industry, there was no corresponding growth in employment. Chemical firms that devoted themselves to running lean during the recession were able to ramp up production without hiring-or rehiringworkers.

In the U.S., a years-long decline in chemical industry employment steepened during the recession years. From 2007 to 2009, the industry lost 57,000 jobs, of
which 25,000 were in production, according to the U.S. Department of Labor. In the decade since 2000, the industry lost 196,000 workers, a shrinkage rate of $2.0 \%$ per year. The pace of the decline in the chemical industry, however, is slower than the $3.6 \%$ annual decrease in employment in the overall manufacturing sector.

In 2010, the chemical workforce fell by 20,000 jobs or $2.5 \%$, according to the Labor Department. On the output side, however, U.S. chemical shipments rose $11.5 \%$ com-
pared with 2009. Of 16 companies tracked by C\&EN, Dow Chemical, H.B. Fuller, NewMarket Corp., PPG Industries, and Stepan had more employees in 2010 than in 2007, the peak year of U.S. chemical production.

Meanwhile, pharmaceuticals topped most other U.S. industries in laying off workers in 2010. According to outplacement firm Challenger, Gray \& Christmas, drugmakers pink-slipped 54,000 employees. Among those workers were roughly 19,000 who were victims of Pfizer's purchase of Wyeth and 16,000 who were dropped during the combination of Merck \& Co. and Schering-Plough.

OUTSIDE THE CHEMICAL industry, high unemployment was a drag on the U.S. economy. Throughout 2010, the unemployment rate stayed above 9.5\%, although economists marked June 2009 as the official end of the Great Recession. Workers
who did have jobs spent the year worried about losing them, and consumer confidence remained low.

Low confidence in the global recovery was also evident in the hiring rates in Europe, where chemical employment remained flat. Yet the statistics show Europe's chemical industry was busy in 2010 .

Each of the four European nations tracked by C\&EN posted double-digit increases in chemical shipments. The Netherlands saw the sharpest increase, at $23.7 \%$. The continent's largest chemical-producing coun-try-Germany-reported a $17.6 \%$ increase in value of shipments to $\$ 226.5$ billion.

The story was similar in Japan, where
chemical companies tracked by C\&EN employed the same number of workers in 2010 as in 2009, even as production increased $9.0 \%$. In contrast to the long-term trend in the U.S., chemical employment at the Japanese and European firms tracked by C\&EN was respectively equal to and slightly higher in 2010 than it was a decade ago.

## OVERALL U.S. EMPLOYMENT

The shrinking workforce in the chemicals sectors mirrored that of the overall manufacturing economy in 2010

a Productivity is output per hour, calculated by dividing indexes for production by indexes for workhours of production employees. b Unit labor costs are calculated by dividing indexes for hourly wages by indexes for output per workhour. SOURCES: Federal Reserve Board, Department of Labor

# SOCMA's 8th Annual CHEMICAL INDUSTRY GOLF TOURNAMENT benefiting the ACS Scholars Program <br> Close to Philadelphia! | Chester Valley Golf Club | Malvern, PA 

TOURNAMENT SCHEDULE (Subject to change)

10:00 AM - 12:30 PM ...... Registration
10:30 AM - I2:30 PM . . . . . . Lunch Buffet
10:30 AM - 12:30 PM . Free Practice Area 12:30 PM
. . . . . . . . . . . . . . Shotgun Start Scramble Format
5:45 PM - 6:45 PM $\qquad$ Cocktails

6:45 PM - 9:00 PM ..... Buffet Dinner \& Awards Ceremony

## REGISTRATION FEES

(Competitive and "Red" Teams Available)
Early Bird: (ends August 26, 2011, 5:00 PM EDT)

- \$1,300 per foursome / \$325 per person
- \$ 85 Reception/Dinner only

Regular Rate:

- \$1,400 per foursome / \$350 per person
- \$ 100 Reception/Dinner only

Fee Includes: Greens Fee, Golf Cart Fees for Foursome, Range Balls, Beverage Cart, Buffet Lunch, Reception and Dinner Buffet

SOCMA is hosting a one-day golf tournament to raise money for the American Chemical Society (ACS) Scholars Program. Proceeds will help sponsor scholarships for qualified applicants who want to enter the fields of chemistry, biochemistry or chemical engineering and students seeking degrees in chemical technology. For the past seven years, SOCMA has teamed up with ACS to raise awareness of this cause and support careers in science.

REGISTER ONLINE TODAY! www.socma.com/golf QUESTIONS? Contact Alicia Massey at (202) 721-4165.

# OUTPUT RAMPS UP IN ALL REGIONS 

Chemical PRODUCTION increased markedly over that in 2009, thanks to demand from developing economies

THE GLOBAL ECONOMIC recovery lifted all boats in the chemical industry in 2010, as it did for manufacturing industries as a whole. Chemical production was up for almost all categories of chemicals in the U.S., Canada, Japan, South Korea, Taiwan, and China. Statistics for European chemical production lag by a year, so 2010 data are unavailable, but output in 2009 mirrored the sharp decreases experienced in the U.S. that year.
Although businesses and consumers in
the developed economies of the U.S. and Europe mostly stayed on the sidelines during the recovery, developing economies such as China and Brazil began to ramp up manufacturing as early as midyear 2009. Those regions continued to boost demand for chemicals in 2010.

Proximity to China may explain why production indexes showed that growth in chemicals was stronger in Asia than in the U.S. and Canada. Japan upped its output of all chemicals by $9.0 \%$ in 2010 compared
with 2009. In South Korea the increase was $6.8 \%$, and in Taiwan it was $9.0 \%$. For the latter two countries, 2010 marked a record year for chemical production. In Japan, by contrast, chemical output would need to increase again by more than 9\% to reach the record set in 2007.

In the U.S., overall chemical output nudged up $3.5 \%$. It would need to tack on another $15.5 \%$ of improvements in production to reach 2007 levels, and that will likely take many years. The story in Canada was similar. Although a years-long decline in chemical output was reversed in 2010, it is about $15 \%$ below the high-watermark year of 2004. Still, Canadian plants' output grew $4.3 \%$ from the prior year.
U.S. output shot up for aniline, benzene, 1,3-butadiene, and cumene, all of which grew at double-digit rates. For inorganics, all but ammonium nitrate, hydrochloric and phosphoric acid grew more than $10 \%$ compared with 2009. Among plastics, production of

PVC and copolymers grew at just under 10\%. And even nylon, olefin, and polyester fibers turned around a decadelong slide.
In Asia, production of acrylonitrile, benzene, and purified terephthalic acid increased almost 10\%. In Japan, production
of hydrogen peroxide and nitrogen soared $23.4 \%$ and $16.5 \%$, respectively. But Japan has slid to third place in the production of the building block chemical ethylene, after South Korea and China.

For its part, China expanded its output of
methanol, which it produces from abundant coal reserves, by 38.9\%. Japan, South Korea, and Taiwan all boosted manufacturing of plastics, especially polypropylene in Japan, polystyrene in South Korea, and acryloni-trile-butadiene-styrene in Taiwan.

## U.S. PRODUCTION INDEX

Most chemical categories rose, but alkalis and chlorine showed the strongest recovery

# GROWING ECONOMIES PUMP UP COMMERCE 

Jump in TRADE was a measure of recovery for the chemical industry

IN THE DECADE through 2008, the value of chemical products shipped around the globe increased at a faster pace than chemical production. In 2009, the trade fervor finally took a break, but it resumed again with a bang last year, restarting a trend that the recession had interrupted.

In the U.S., trade ran ahead of the recovery; chemical exports in 2010 surpassed the 2008 high watermark, reaching a new peak of $\$ 189.1$ billion. Meanwhile, chemical production in the U.S. was still significantly down from its 2007 level.

The increase in demand for chemicals,
especially from economies growing faster than the U.S. economy, helped power a near-doubling of the U.S. chemical trade surplus to $\$ 15.6$ billion. In particular, the U.S. enjoyed a growing plastics surplus, and it shrank its trade deficit in organic chemical products in 2010 compared with 2009.

Trade with the developing world also boosted exports from Europe. On the plus side were European shipments to Brazil, China, India, and Russia, all of which grew by more than $20 \%$ in 2010 . On the import side, Europe's imports of chemical

Chinese chemical trade deficit in 2010: \$18 billion
products decreased only from Canada. Canada, the largest single-country trading partner of the U.S., whittled its trade deficit to $\$ 12.6$ billion from $\$ 13.0$ billion in 2009. The biggest swing came from basic chemicals, which changed from a $\$ 342$ million deficit to a $\$ 426$ million surplus in just one year.

South Korea and Japan continued to enjoy a healthy trade surplus in chemicals, as they have for many years. The amount of trade increased considerably in 2010, compared with a severe contraction in 2009. South Korea exported twice as many petrochemicals as it imported, for a surplus of just over \$20 billion. Japan's exports of high-value synthetic resins were responsible for more than half of the \$27.1 billion chemical trade surplus.

China, by contrast, is a major importer of chemicals, and it had an $\$ 18.1$ billion overall trade deficit in chemicals in 2010. Most of that gap was due to a shortfall in organic chemicals worth $\$ 16.5$ billion. China's fertilzer surplus was $\$ 2.9$ billion.

## U.S. TOTAL TRADE

Chemical industry held on to its number two spot among exporting sectors
